Diesel Vehicle Regulation Overview

Course #512

The Air Resources Board has several new and existing regulations designed to reduce emissions from diesel vehicles used in California in a variety of activities including on-road commercial trucks and busses; diesel vehicle idling; transport refrigeration units (TRU); drayage trucks used at ports; construction; mining, other off-road; and other industries. Additionally, Green House Gas (GHG) control strategies including requirements related to EPA SmartWay standards are soon to be requirements for diesel vehicles in California. These regulations are needed to meet federal air pollution mandates, reduce the public's exposure to cancer-causing exhaust, as well as decrease the carbon footprint from diesel powered vehicles. The regulations require owners to report to ARB and then to retrofit, repower, or replace their diesel-fueled vehicles gradually over the next decade.

To assist these owners with their compliance efforts, Course 512 provides an overview of each regulation, compliance requirements as well as funding opportunity information. In addition, the training provides access to other assistance tools such as toll free numbers, main contact information, access to program webpages, list serves, and program updates to help navigate the information available at the ARB. This course is designed to provide an overview of many diesel programs and will be presented similarly at each training.

Presentation handouts can be downloaded from the website:

www.arb.ca.gov/webtraining/videos/512/512.pdf. The course is available on line at for reviewing content afterward..

January 21, 2010

9:00 AM - 3:00 PM

South Coast AQMD

21865 E Copley Drive

Diamond Bar, CA 91765

**Registration will be on site and seating
will be limited so arrive early**
